➔ Man made disasters

# NATURAL DISASTERS\* TREND 1950-2009

World Health Organization

■ Earthquake, volcano, dry mass mov. ■ Climate-related disasters

\* Biological disasters excluded

Debarati Guha-Sapir

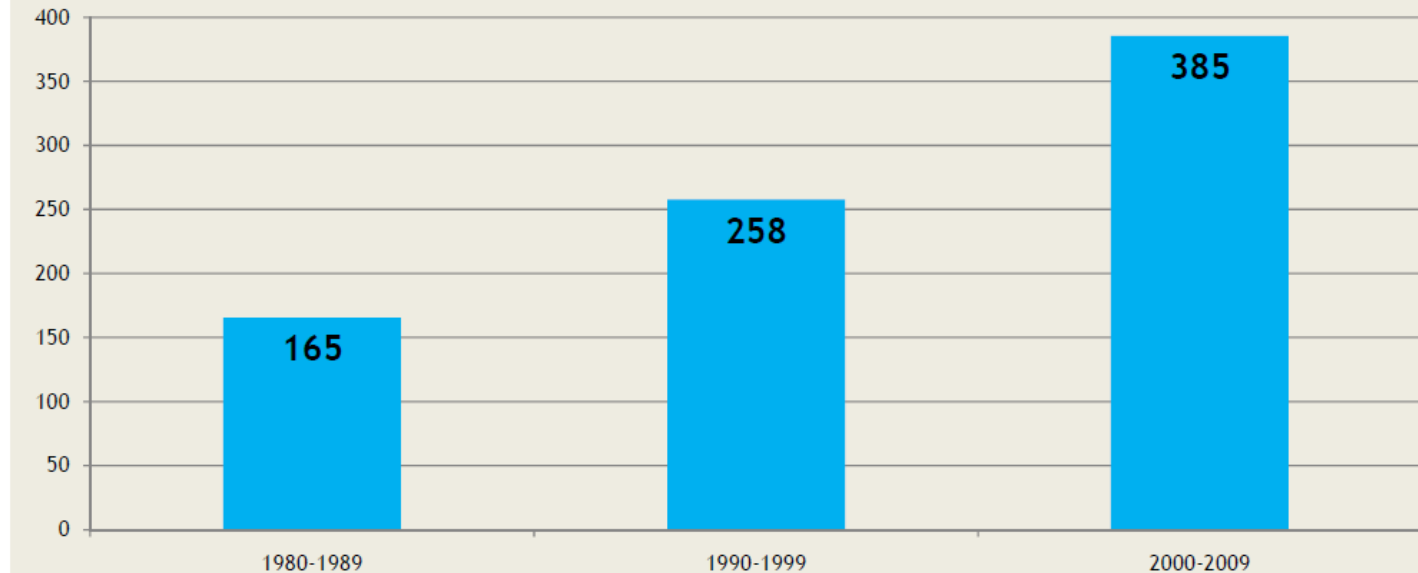

FONDATION MÉRIEUX

# 133% more events in 2000-2009 than in 1980-1989

## Annual average disaster occurrence: 3 decades comparison

World Health Organization

Debarati Guha-Sapir

FONDATION MÉRIEUX

# FACTS AND FIGURES FOR THE DECADE : 2000-2009

- 60% people died because of earthquakes in the last decade, followed by storms (22%) and extreme temperatures (11%)
- 85% of fatalities were in Asia
- Average total affected people follow the same trend as previous decades; mainly due to climate-related events
- Total economic losses vary from one decade to the other; but are mainly due to floods and storms

World Health Organization

Floods; Jordan

Earthquake; Zante Isl., Greece

Hurricane Willa; Mexico

Floods and storms; Krasnodar Krai, Russia

# C.R.E.D .

- In 1988, the **Centre for Research on the Epidemiology of Disasters (CRED)** launched the Emergency Events Database (EM-DAT). EM-DAT was created with the initial support of the **World Health Organisation (WHO)** and the **Belgian Government**.
- The main objective of the database is to serve the purposes of **humanitarian action at national and international levels**. The initiative aims to rationalize decision making for **disaster preparedness**, as well as provide an objective base for **vulnerability assessment and priority setting**.
- **In 2017, 335 natural disasters affected over 95.6 million people**, killing an additional 9,697 and costing a total of US \$335 billion.
- Asia seemed to be the most vulnerable continent for floods and storms, with 44% of all disaster events, 58% of the total deaths, and 70% of the total people affected.

# World Humanitarian Summit 2016 (Istanbul)

## CHAPTER 5: CREATE CERTAINTY IN RESPONDING TO DISASTERS

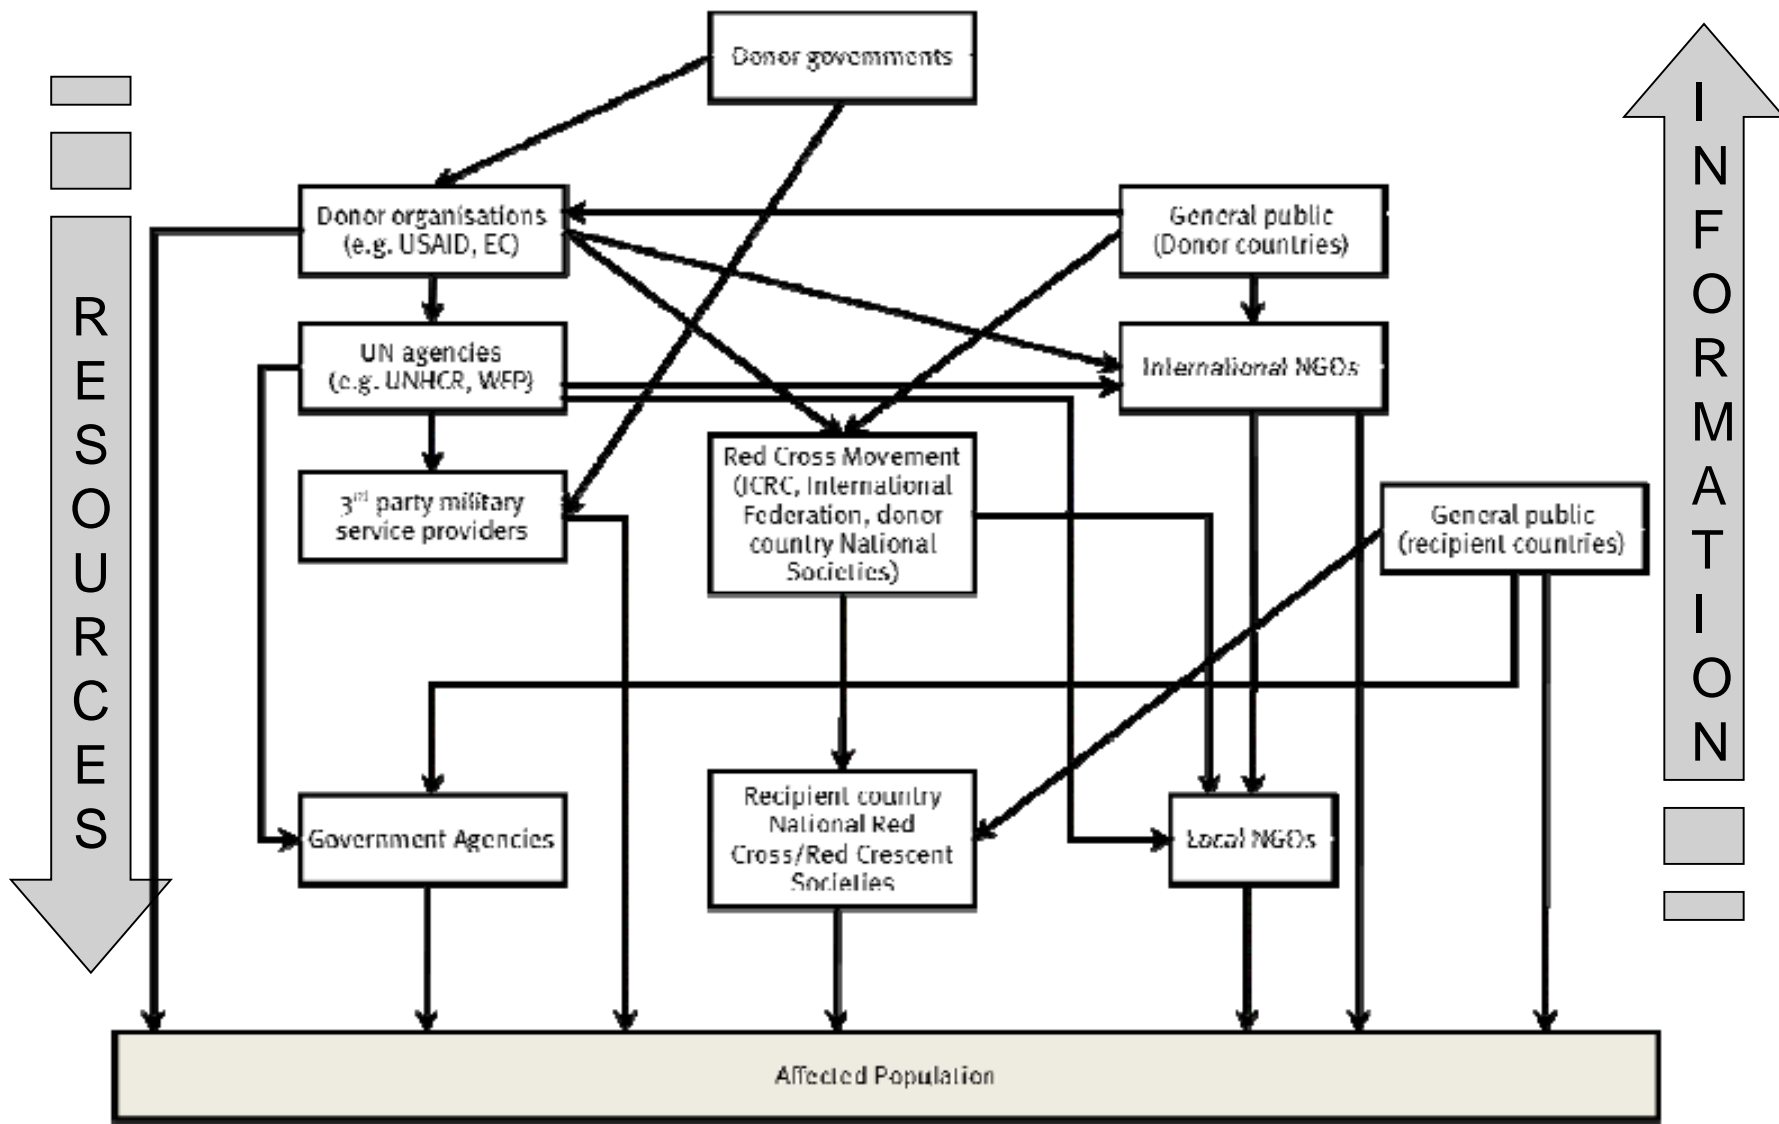

A shift to a collective approach to crisis management. It will require a strong emphasis on planning beforehand, securing firm political and financial commitments to respond, managing disaster risk, and reducing vulnerability to humanitarian stress.

The consultations issued a strong call to:

- ✓ increase investment in preparedness, risk reduction, and predictable response arrangements in advance of shocks;
- ✓ agree on cooperation arrangements in advance for a more predictable, inclusive and disciplined approach to disaster response;
- ✓ scale-up and sustain social protection measures to provide an essential package of support to the most vulnerable people as a norm for the longer-term provision of assistance;
- ✓ build best practice on how to manage and respond to disaster risk

# The system is made up of multiple actors, relationships, resource and information flows

(ANALP)

# INCLUSIVE HEALTH

**The approach of “Humanity and Inclusion” a transnational NGO’s located in Lyon - France**

Over  
**1 BILLION**  
people globally  
experience  
disability

**1** in **7** people

People with disabilities have the same  
general health care needs as others

But they are:

**2x** more likely to find health  
care providers' skills and  
facilities **inadequate**

**3x** more likely to be  
**denied** health care

**4x** more likely to be treated  
**badly** in the health  
care system

**1/2**

of people with  
disabilities cannot  
afford health care

They are:

**50%**

more likely to suffer  
catastrophic health  
expenditure

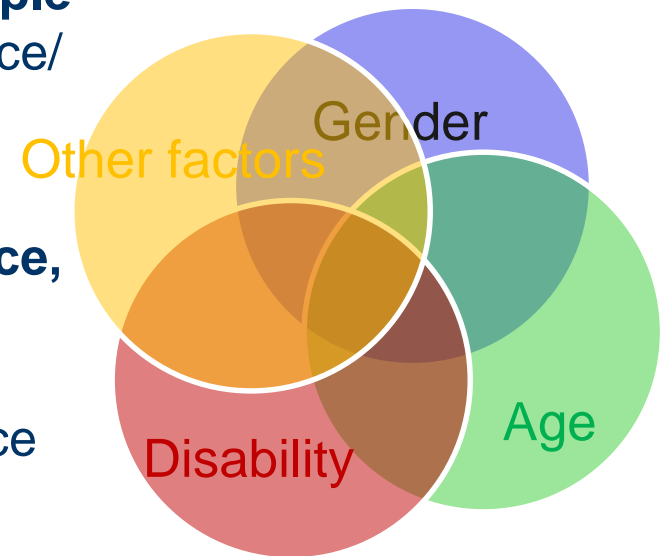

These out-of-pocket  
health care payments  
can push a family  
into poverty

Rehabilitation and assistive devices can enable people with disabilities to be independent

# Challenges faced by persons with disabilities in humanitarian emergencies

- ▶ **Disproportionately** affected and **face multiple barriers** in accessing humanitarian assistance/services
- ▶ **Exposed to several threats: targeted violence, exploitation, abuse**, including sexual and gender-based violence, **discrimination** and **restricted access** to humanitarian assistance
- ▶ Multiple and intersecting forms of discrimination based on their **age, gender, disability**, other factors **further exacerbates exclusion** and often leads to **further impairment**

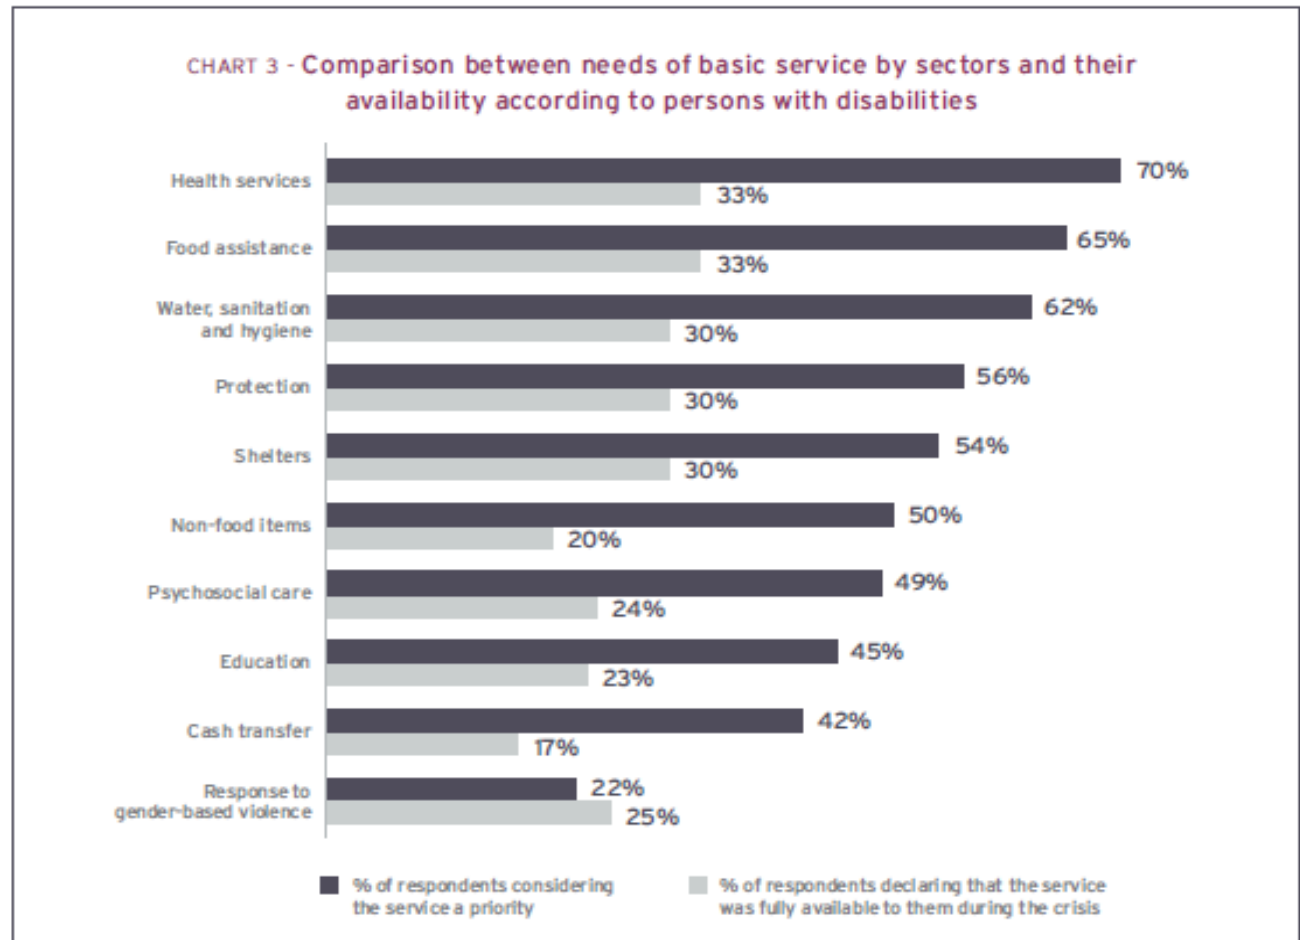

# People with disabilities: Gaps in access to services in humanitarian response

75% of people with disabilities believe they are excluded from humanitarian responses to emergencies like natural disasters and conflict

## Comparison:

▶ People who considered the service a priority  
(VS)

▶ People who had access to the service

*(International survey of people with disabilities, disabled people's organizations and humanitarian actors, Handicap International, 2015)*

# Factors that lead to Exclusion

- **Poor or lack of Identification** of persons with disabilities and their specific needs (lack of disaggregated data on Sex, Age, Disability)
- **Lack of consultation or participation** of persons with disabilities and their representatives in assessments and throughout program cycle
- **Limited knowledge and capacity of actors** to deliver inclusive services at the organizational, programmatic and service delivery levels
- **Lack of staff capacity, knowledge and skills** to communicate with and adapt their practices for persons with disabilities
- **Lack of coordination among humanitarian actors** and local skills and expertise
- **Poor or lack of identification of numerous barriers to access** and actions to reduce them

SOCIETY

**N**OTHING WORKED. FOR NINE MONTHS DR. CYNTHIA Gibert desperately tried one antibiotic after another on her 57-year-old kidney patient, but no matter which tablets, capsules or even IVs she gave him—from plain-vanilla ampicillin to fancy experimental teicoplanin—the man's blood was still flooded with enterococcus bacteria, which were slowly poisoning his red blood cells. "We tried six or seven different medications. Some alone. Some in combination. Some we didn't think would work. But we had nothing else to try," says Gibert, an infectious-disease specialist at the Veterans Affairs Medical Center in Washington. Sometimes her patient's blood tested clean, but within days the infection came roaring back: a few rogue bacteria, no more threatened by the antibiotics than an urban gang by a pop gun,

pneumonia, septicemia (blood poisoning), syphilis, gonorrhea and other bacterial infections that hark back to a time of high-button shoes were vanquished. Yes, people died—and still die—from these ills, but not so many, and not those who began antibiotics before the microbes wrecked some vital system. "The perception [in the 1980s] was that we had conquered almost every infectious disease," says Dr. Thomas Beam of the Buffalo, N.Y., VA Medical Center. Science was sure the real challenges would lie in the conquest of cancer, heart disease and other chronic ailments. Instead, "medicine's purported triumph over infectious disease has become an illusion," writes Dr. Sherwin Nuland in his best-selling "How We Die."

Indeed, it looks like medicine declared victory and went home too soon. Every disease-causing bacterium now has versions that resist at least one of medicine's 100-plus antibiotics. Some resist all but one (chart, page 48). Drug-resistant tuberculosis now ac-

# The End of Antibiotics

SCIENCE THOUGHT IT HAD VANQUISHED INFECTIOUS DISEASES. BUT NOW THE BUGS ARE FIGHTING BACK.

BY SHARON BEGLEY

bided their time until their more vulnerable cousins had been killed. Then they multiplied by the billions. So one morning last year, Gibert gathered her courage and walked softly into the man's room. "I guess you're coming to tell me I'm dying," he said. Nothing had worked, she explained; they had run out of options. Antibiotics, the miracle drugs of the 20th century, had been bested by bacteria, the most primitive organisms on earth. Several days later the man died of a massive bacterial infection of the blood and heart.

Ever since 1928, when Alexander Fleming serendipitously discovered penicillin oozing out of mold in a laboratory dish, "man and microbe have been in a footrace," says Dr. Richard Wenzel of the University of Iowa. It's a race in which the lead keeps changing. In 1946, just five years after penicillin came into wide use with World War II, doctors discovered staphylococcus that was invulnerable to the drug. No problem: smart pharmacologists invented or discovered (often in samples of soil they collected like souvenirs whenever they visited exotic locales) new antibiotics. The drugs pounded the microbes into submission once again. But the bacteria regrouped, and mutants capable of fending off the latest drugs appeared. New drugs, newer mutants. And so it went. Overall the drugs retained a slight lead and, slowly, scourges such as tuberculosis, bacterial

counts for one in seven new cases; 5 percent of those patients are dying. Several resistant strains of pneumococcus, the microbe responsible for infected surgical wounds and some children's ear infections and meningitis, appeared in South Africa in the 1970s, spread to Europe and now are turning up in the United States. In January the federal Centers for Disease Control and Prevention (CDC) reported an epidemic of resistant pneumococcus in rural Kentucky and in Memphis. The bugs had spread through day-care centers like a chain letter, leaving toddlers with ear infections, pneumonia and, in six cases, meningitis. In 1992, 13,300 hospital patients died of bacterial infections that resisted the antibiotics doctors fired at them, says the CDC. It was not that they had infections immune to every single drug but rather that, by the time doctors found an antibiotic that worked, the rampaging bacteria had poisoned the patient's blood, scarred the lungs or crippled some other vital organ.

The financial toll is steep, too. Because the first antibiotic prescribed often fails, the patient has to try several; this adds some \$100 million to \$200 million to the nation's health-care tab. "Right now the microorganisms are winning," says Iowa's Wenzel. "They're so much older than we are . . . and wiser."

They are indeed wise, especially in the ways of evolution. Bacteria

# “Without diagnostics, medicine is blind”

- An essential step in patient care
  - Prescribing the right treatment depends on identifying the cause of disease
- A decisive tool in disease surveillance and control
  - Reliable laboratory testing data is needed for outbreak alert and response and to control the spread of antimicrobial resistance
- In developing countries, it is often difficult to gain access to diagnostic testing
  - Strengthening clinical biology capacities drives the Mérieux Foundation’s work in the field

# Providing Quality Infrastructure

- Renovating and strengthening public hospital laboratories in developing countries
  - 37 laboratories renovated (2003 - 2018)

*Madagascar laboratory before and after renovation*
